

Eniac discount & sales analysis

Presented by: Bertha Lwakatare, Marie Hansen & Jade Smukat

High discounts do not guarantee higher sales

Key Insight: Moderate discounts appear sufficient, seasonality has a stronger impact on sales than increasing discount rates

96% of all products were discounted

Discounts of up to 30% are the most common and contribute the highest share of revenue

Limitation: Discounts are based on current product prices, not historical prices

**Higher discounts don't generate proportionally higher sales
therefore, suggesting other influencing factors**

The mathematical correlation between discount and revenue is **-0.03%**

Despite relatively low discounts on Black Friday, revenue and order counts were at the peak, proving influence of other factors such as seasonality on revenue

Additional data needed

- Limited time period: only 15 months of data was provided
- Reasons behind the high discount rate (96%) remain unclear
- More historical sales and discount data needed to evaluate long-term effects

Only **18%** of the raw orderlines data could be used for analysis

EXTRA: The months with the lowest average discount are not the ones with the highest revenue
